

# MAKERERE UNIVERSITY

We Build For The Future

## Climate change, the science, impacts and response

**Climate Justice, Climate Litigation and Climate Action: A global perspective, 10<sup>th</sup> September 2020 at the Speke Resort Hotel  
Muyonyo**

Associate Professor Shuaib Lwasa  
IPCC Lead Author SRCCSLM, Coordinating Lead Author AR6  
Department of Geography, GeoInformatics and Climatic Sciences  
School of Forestry, Environmental and Geographical Sciences  
College of Agricultural and Environmental Sciences,  
Makerere University

# Outline of presentation

- IPCC and its role
- Climate Change Science
- Impacts and Response
- Conclusion

# IPCC

## Creation

**1988:** UN GENERAL ASSEMBLY  
ENDORSED  
THE ACTION BY UNEP AND WMO IN  
JOINTLY **ESTABLISHING** THE IPCC

## Today

**OCT. 2015:** IPCC ELECTED NEW  
**BUREAU** IN CHARGE OF THE **SIXTH**  
**ASSESSMENT CYCLE,**  
**APRIL 2016:** FIRST **SESSION** SINCE

# Policy/Science Interface

- UN body .....

- Intergovernmental Panel (195 member States) .....

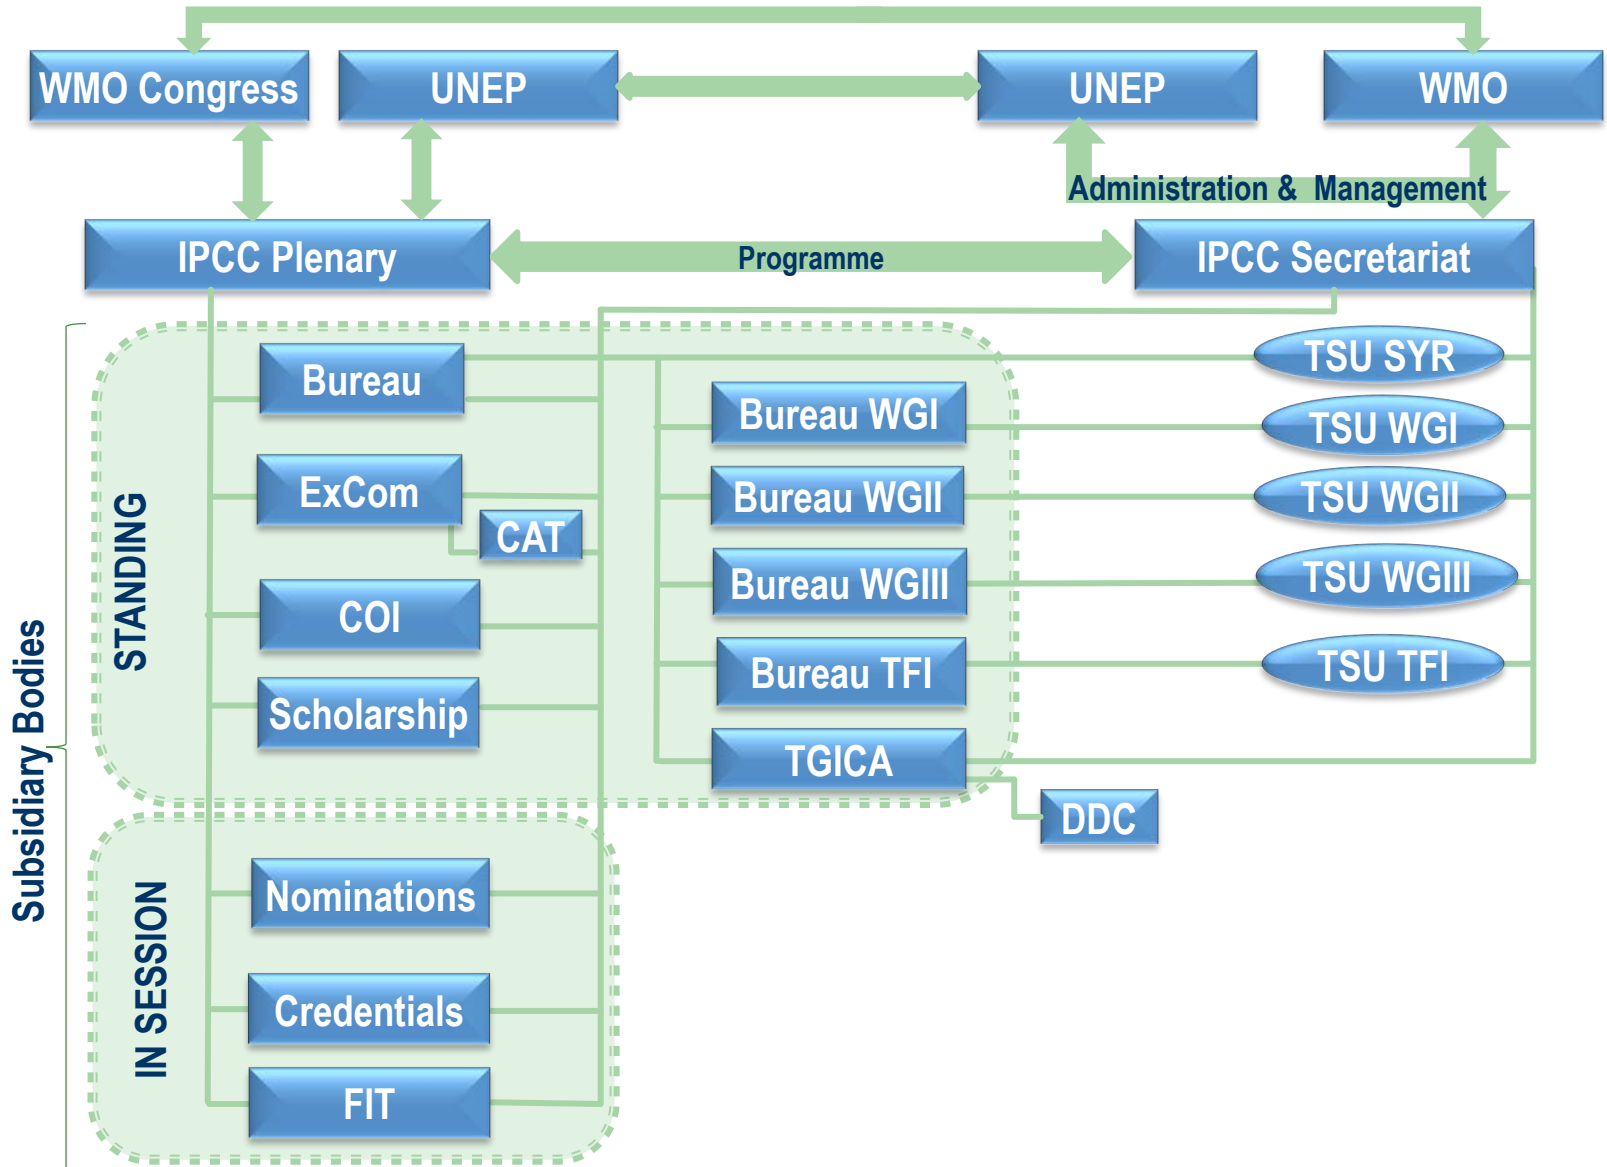

- International scientists and experts .....

IPCC Secretariat

# IPCC Structure

# The role of the IPCC is ...

“... to assess on a comprehensive, objective, open and transparent basis the scientific, technical and socio-economic information relevant to understanding the scientific basis of risk of human-induced climate change, its potential impacts and options for adaptation and mitigation.”

“IPCC reports should be neutral with respect to policy, although they may need to deal objectively with scientific, technical and socio-economic factors relevant to the application of particular policies.”

*Principles Governing IPCC Work, paragraph 2*

*Source: <http://www.ipcc.ch/pdf/ipcc-principles/ipcc-principles.pdf>*

# IPCC Reports

Five assessment reports (1990, 1995, 2001, 2007, 2013-14)

1992 supplementary report and 1994 special report

Nine special reports (1997, 1999, 2000, 2005, 2011, 2012, 2018, 2019)

Guidelines for national GHG inventories, good practice guidance (1995, 2006, 2013)

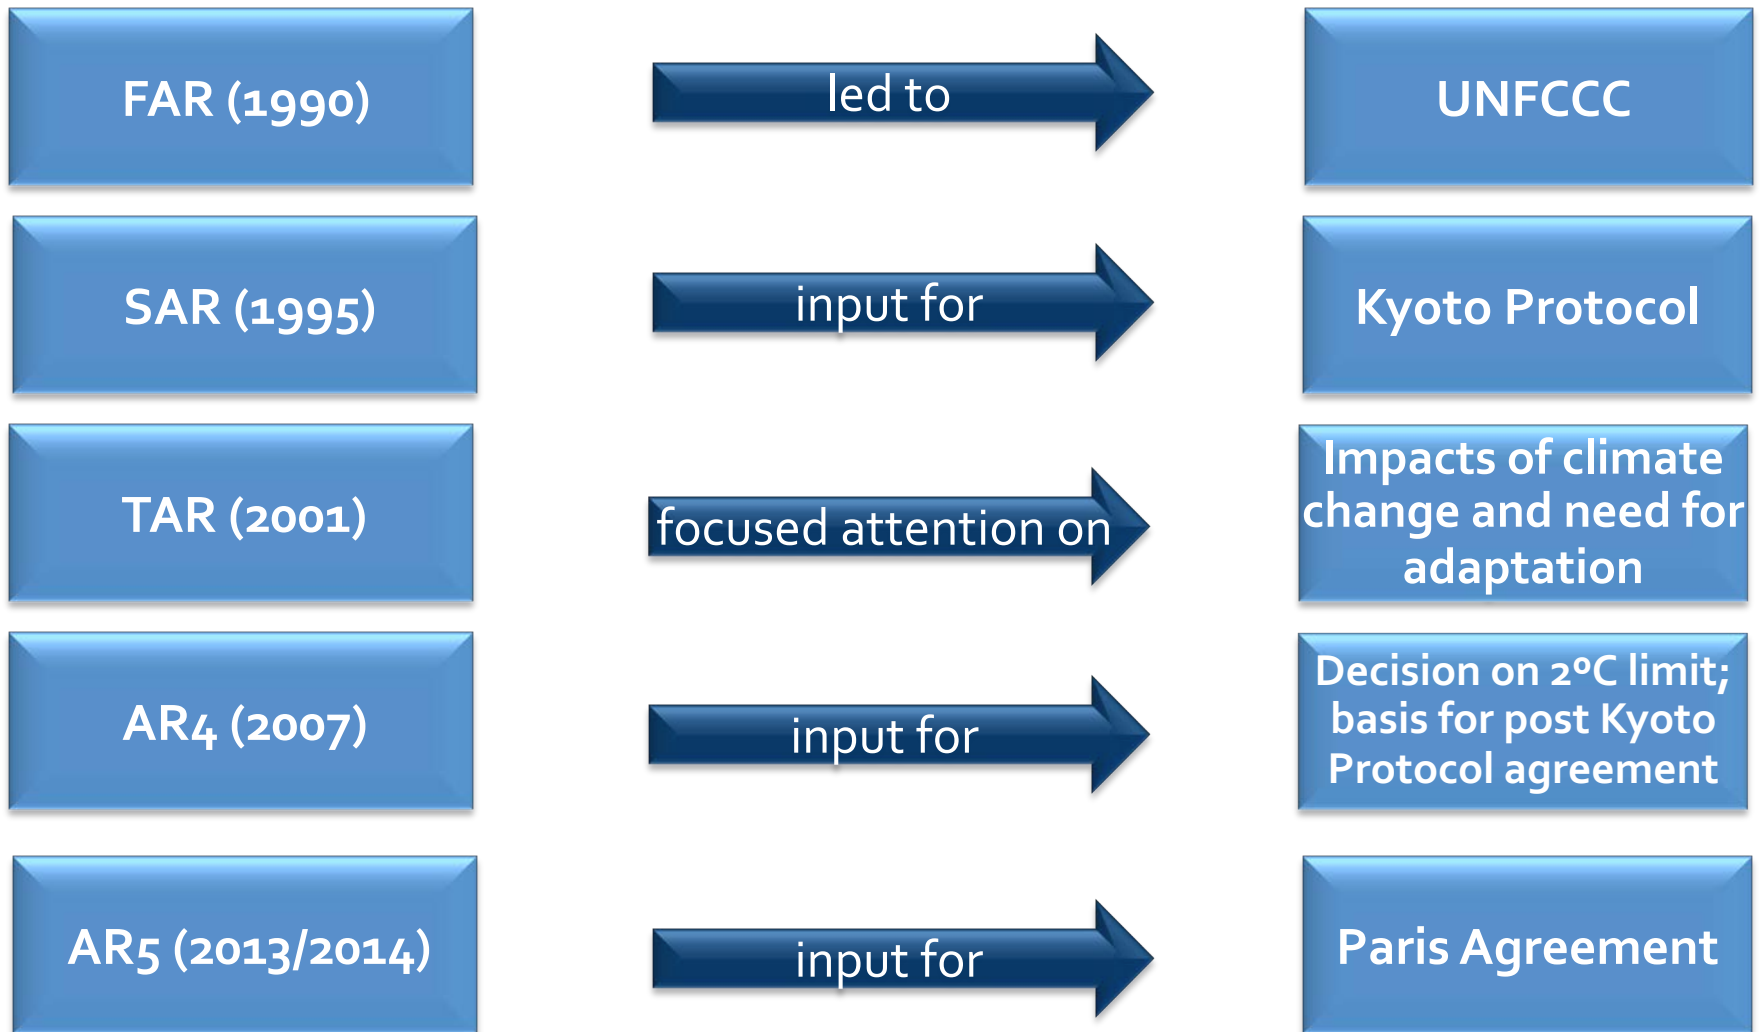

Six technical papers (1996-2008)

# What are IPCC reports used for?

# Achievements: The Assessment Reports

# Other Activities and Achievements

National Greenhouse Gas Inventories  
(Publication of IPCC Methodology Reports)

Task Group on Data and Scenario Support for Impact and Climate Analysis  
(TGICA):  
facilitates distribution and application of climate change related data and  
scenarios)

Organizing expert meetings and workshops to  
facilitate discussion on topics relevant to the  
Assessment process

# Some IPCC Outreach Activities

Argentina, September

2015

Mexico, August 2015

Thailand, August 2015

Kenya, February 2015

Russia, September 2015

Paris, December 2015

Turkey, September 2015

Nicaragua, August 2015

Tanzania, February 2015

# What is next for the IPCC?

## IPCC Decision XLIII-5

“To take the outcomes of the 21st Conference of the Parties to the United Nations Framework Convention on Climate Change (UNFCCC) into consideration when determining the IPCC programme of work and products for the sixth IPCC assessment cycle”

## AR6 cycle Special Reports on

impacts of global warming of **1.5 °C** above pre-industrial levels and related global greenhouse gas emission pathways by 2018

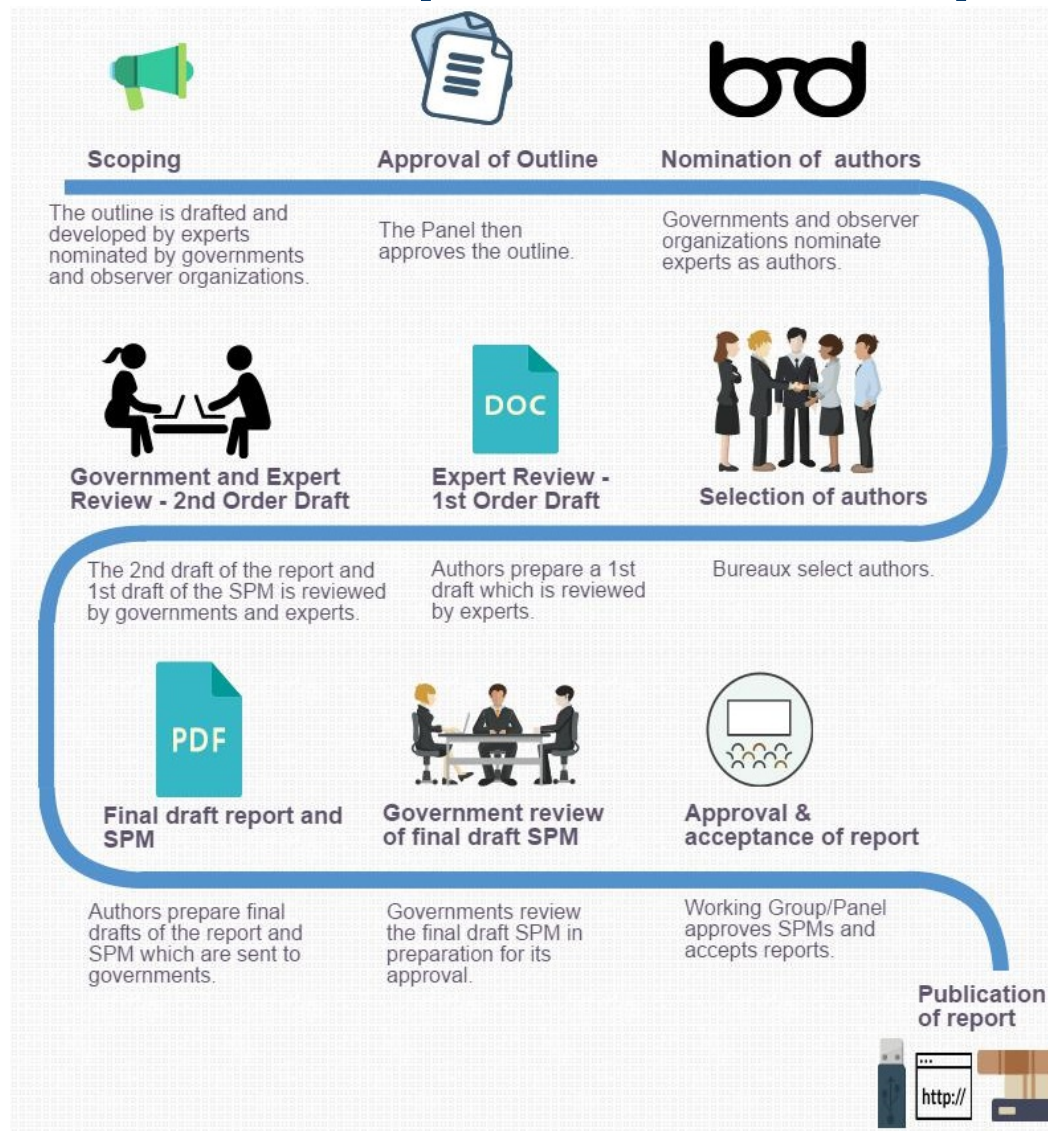

Climate change and **oceans** and the **cryosphere**

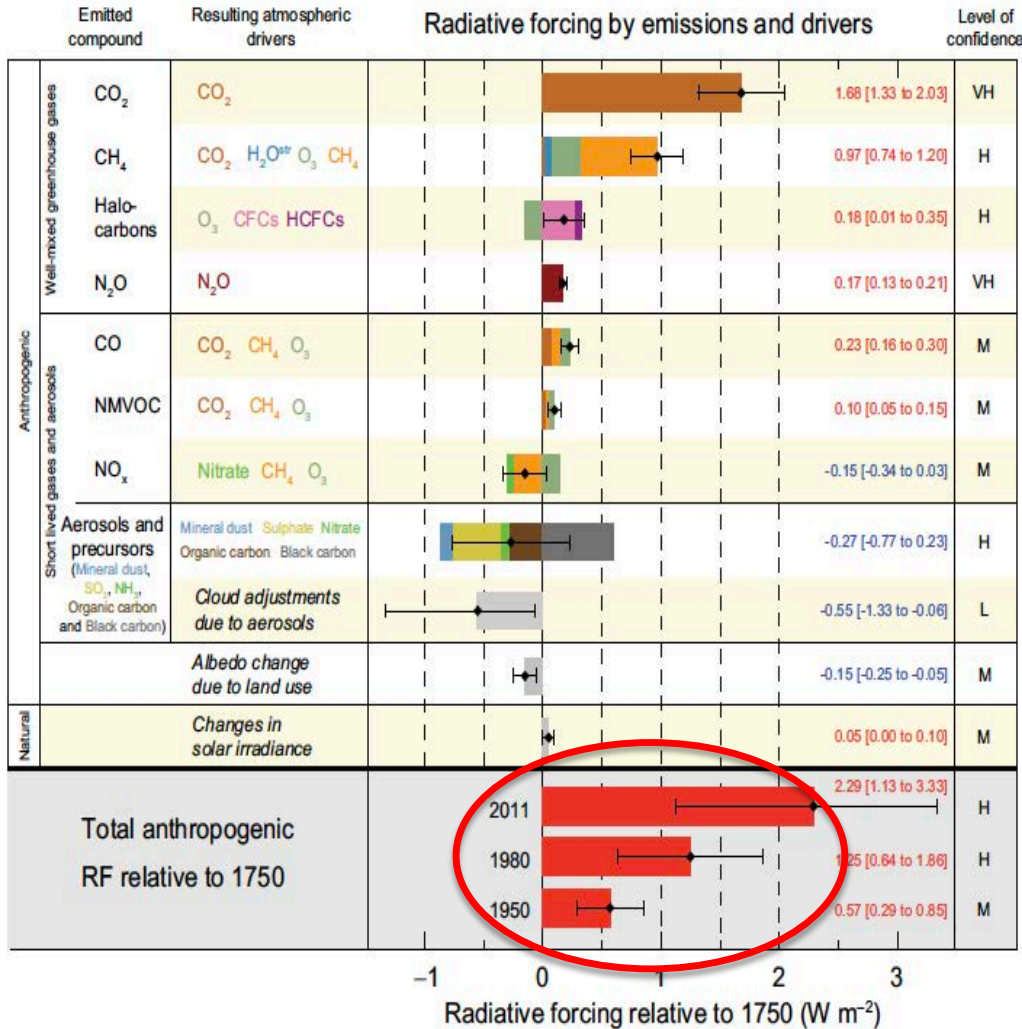

Climate change, **desertification, land degradation, sustainable land management, food security, and greenhouse gas fluxes in terrestrial ecosystems**

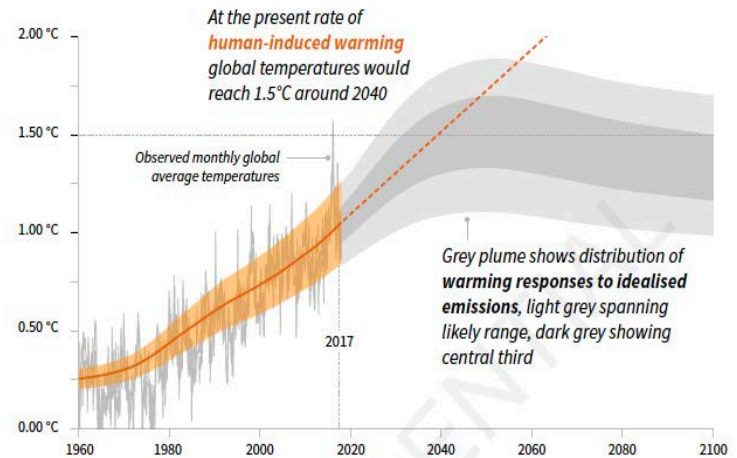

# How the IPCC produces its reports?

# Physical Science Basis

Global warming relative to 1850-1900

# Anthropogenic perturbation of the global carbon cycle

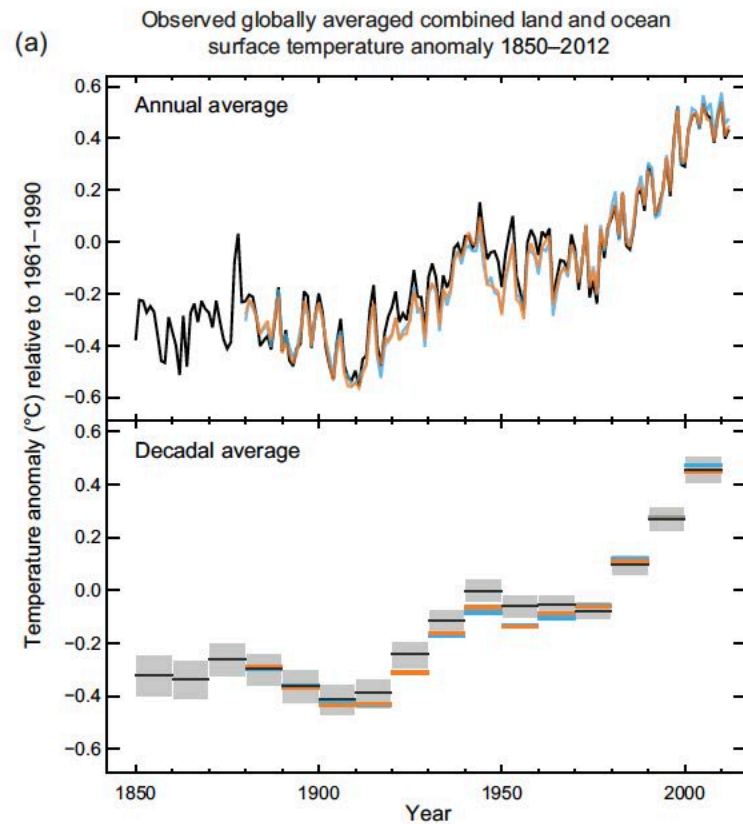

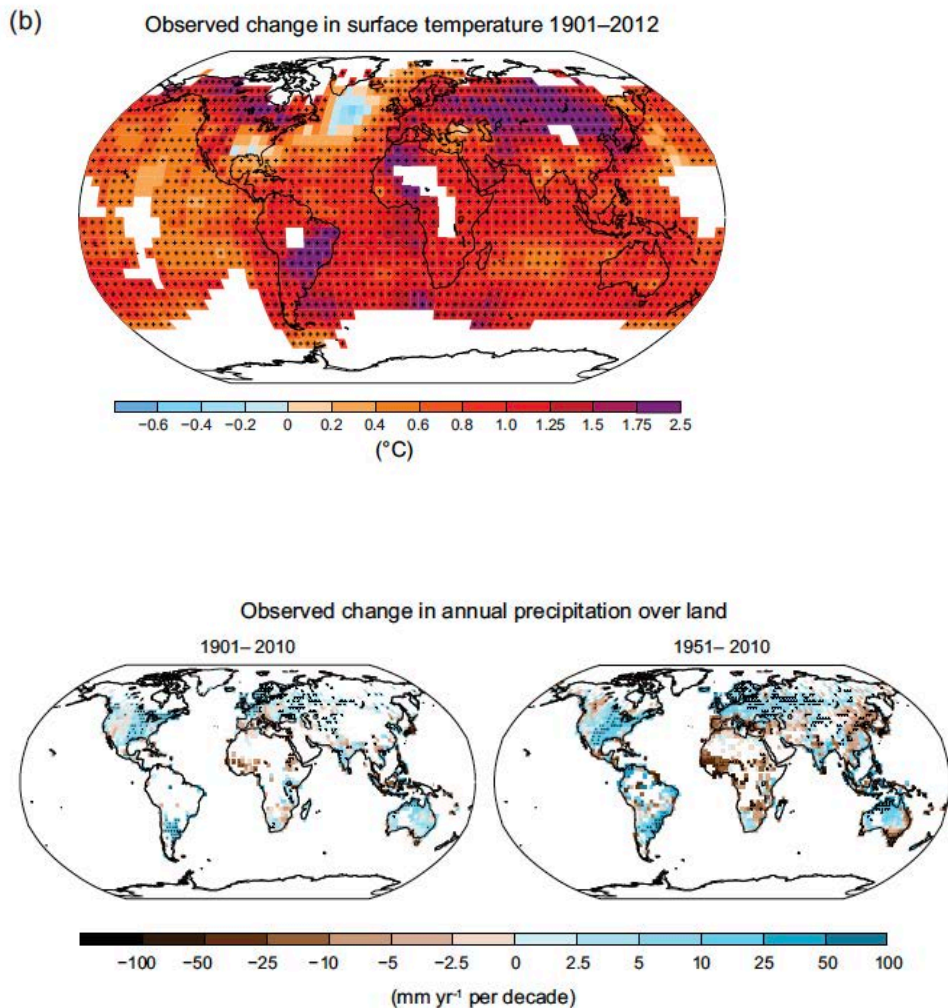

Perturbation of the global carbon cycle caused by anthropogenic activities, averaged globally for the decade 2008–2017 (GtCO<sub>2</sub>/yr)

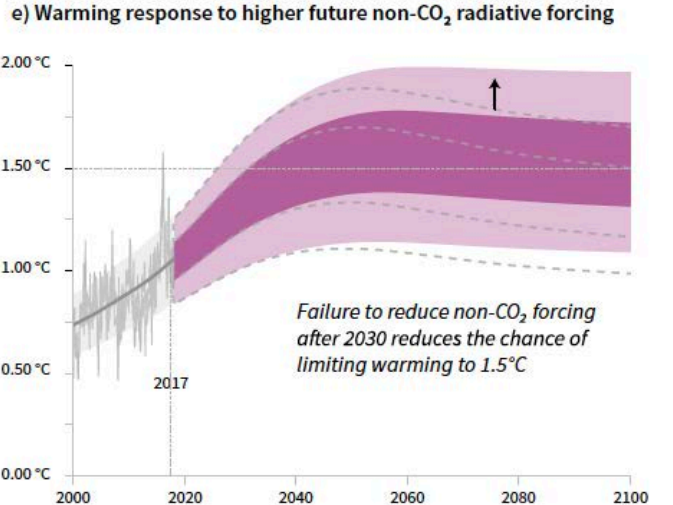

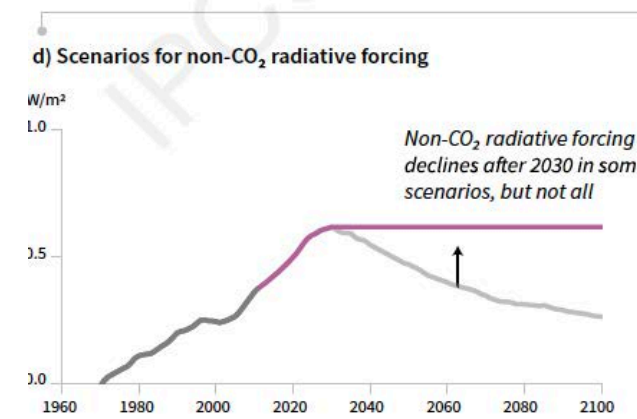

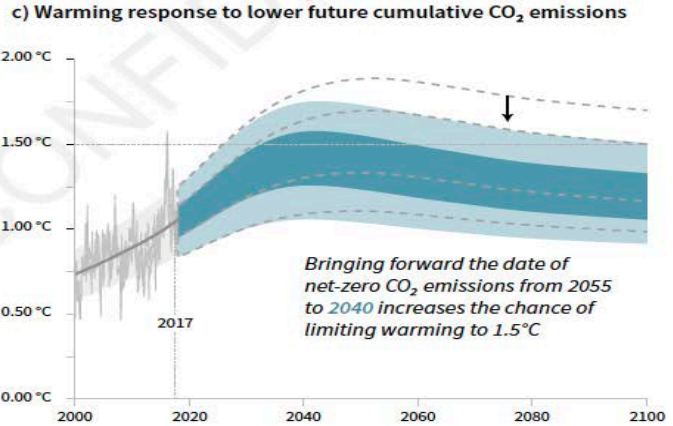

The budget imbalance is the difference between the estimated emissions and sinks.

# Physical Science Basis

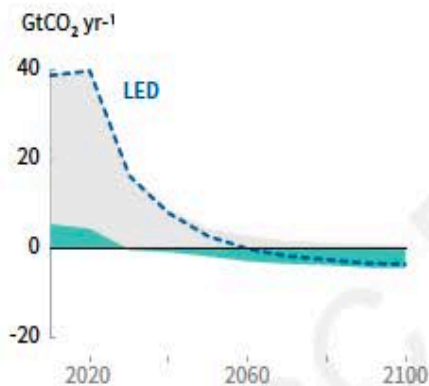

# Physical Science Basis

# Physical Science Basis

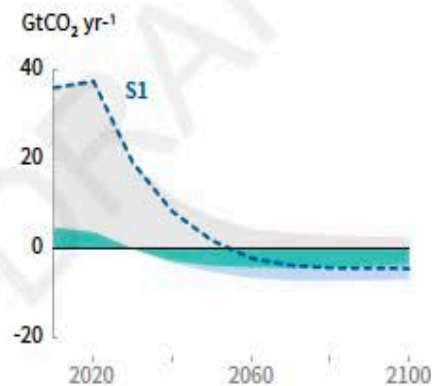

## Breakdown of contributions to global CO<sub>2</sub> emissions in four archetype pathways [GtCO<sub>2</sub> yr<sup>-1</sup>]

● Fossil fuel and industry ● AFOLU ● BECCS

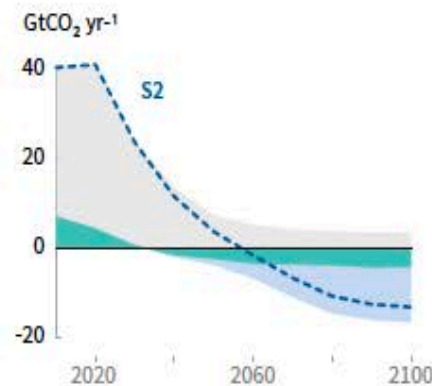

### Pathway LED

A scenario in which social, business, and technological innovations lead to dramatic reductions in the energy needed to provide useful services, resulting in lower energy demand to 2050 while living standards rise, particularly in the global South. A down-sized energy system enables rapid decarbonisation of energy supply. Afforestation is the only CDR option considered; neither fossil CCS nor BECCS are used.

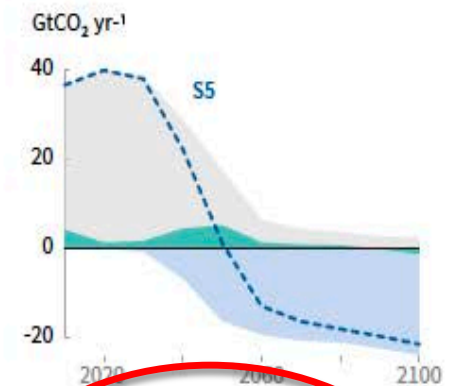

### Pathway S1

A scenario with a broad focus on sustainability and a shift towards energy intensity improvements, human development, economic convergence and international cooperation, sustainable and healthy consumption patterns, low-carbon technology innovation, and well-managed land systems with limited societal acceptability for BECCS.

### Pathway S2

A middle-of-the-road scenario in which societal as well as technological development follows historical patterns. Emissions reductions are mainly achieved by changing the way in which energy and products are produced, and to a lesser degree by demand reductions.

### Pathway S5

A resource and energy-intensive scenario in which rapid economic growth and globalization lead to widespread adoption of greenhouse-gas intensive lifestyles, including high demand for transportation fuels and livestock products. Emissions reductions are mainly achieved through technological means, making strong use of CDR through the deployment of BECCS.

# Physical Science Basis

## Global CO<sub>2</sub> emissions in 1.5°C-consistent pathways (four archetype pathways are highlighted)

Global total CO<sub>2</sub> emissions [GtCO<sub>2</sub> yr<sup>-1</sup>]

## Non-CO<sub>2</sub> emissions relative to 2010

Emissions of non-CO<sub>2</sub> forcers are also reduced in 1.5°C-consistent pathways but they do not reach zero levels

### Methane

CH<sub>4</sub> emissions [relative to 2010]

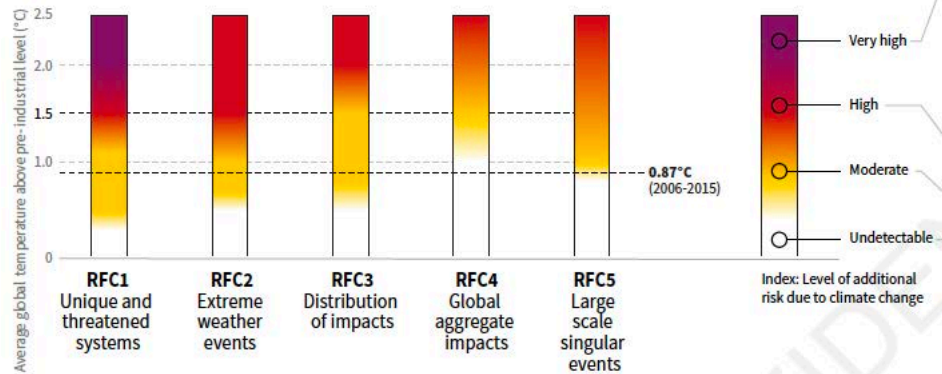

### Black Carbon

BC emissions [relative to 2010]

# Risks for Concern and Risks to specific natural human and managed systems

Risk associated with the Reasons for Concern (RFCs)

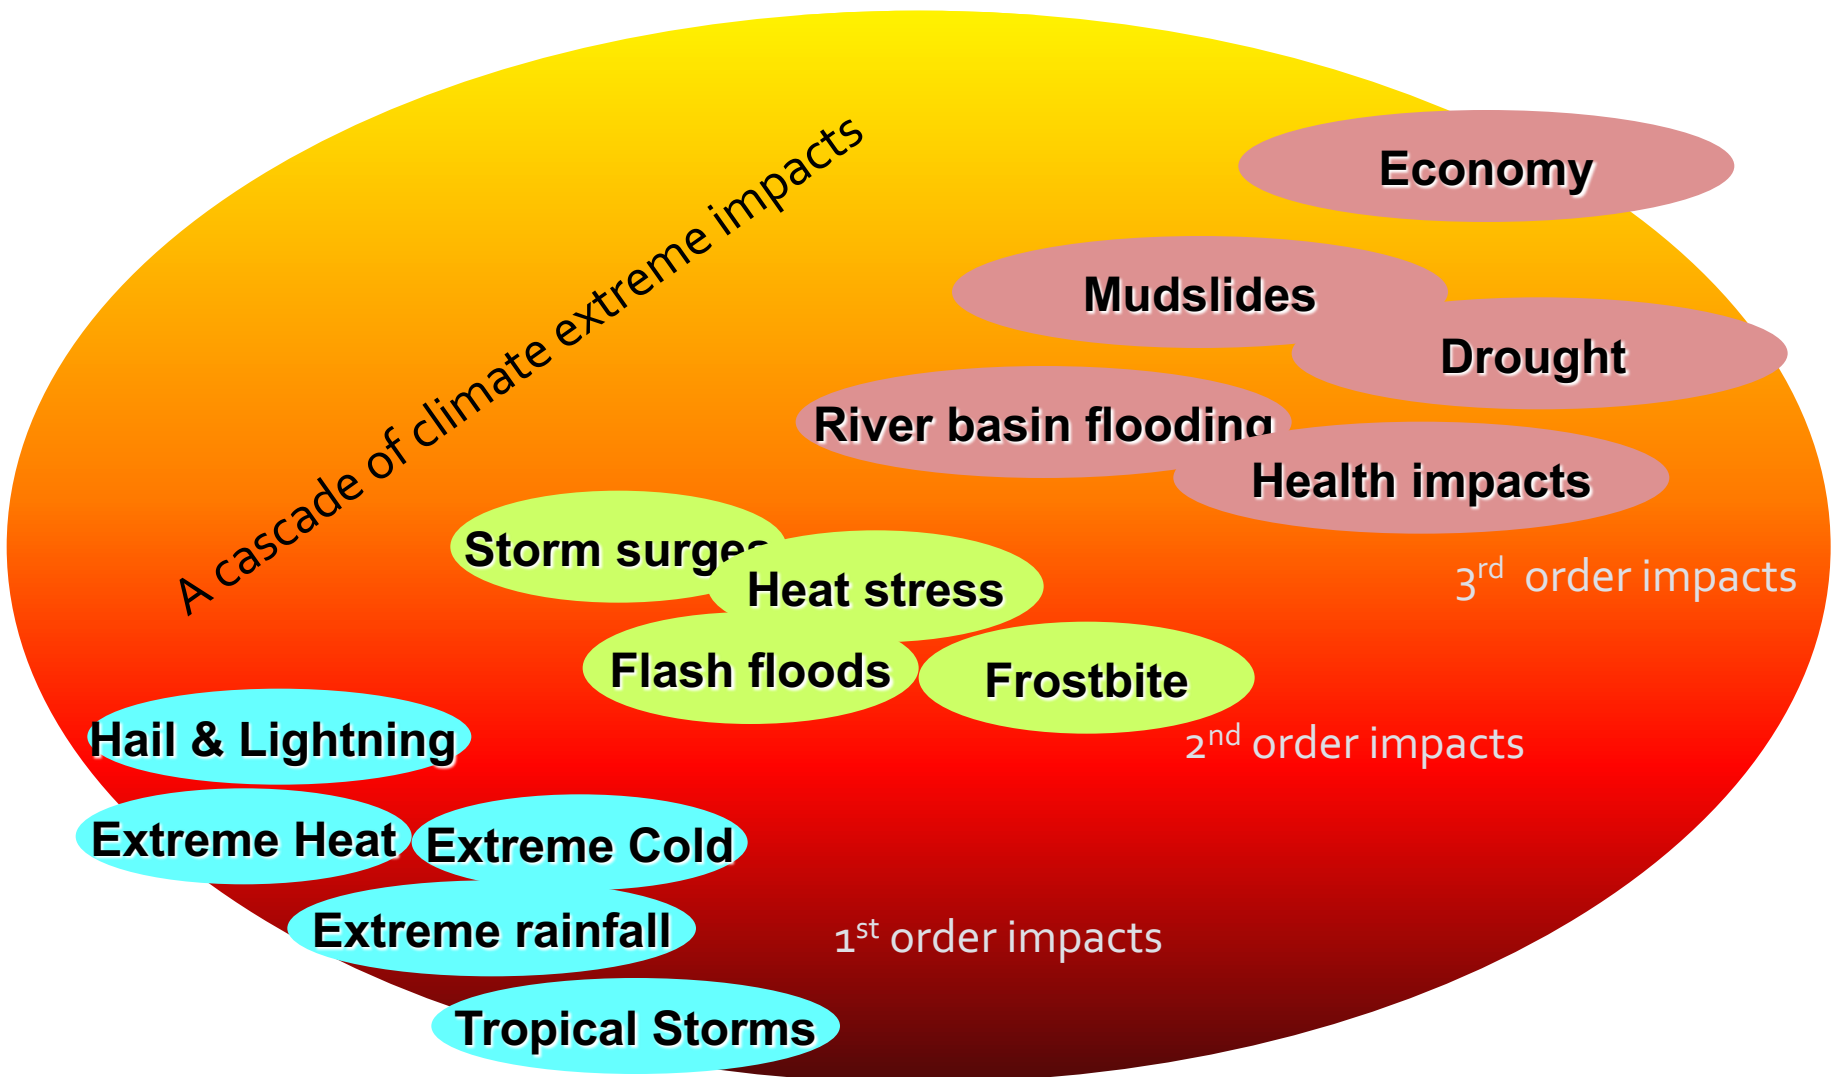

Risks for specific natural, managed and human systems

The key elements are presented here as a function of the risk level assessed between 1.5 and 2°C.

# Climate Extremes and Impacts

High frequent hydroclimatological hazards becoming common in Africa

# SR 1.5 Degrees and SRCCLM global and regional impacts

Warming of 1.5° C or less  
 Warming of 1.5°C-2° C  
 Warming > 2° C

*L, likely*  
*VL, very likely*  
*LC, low confidence*  
*MC, medium confidence*  
*HC, high confidence*

## West African and the Sahel

- Monsoon : **uncertain** ; **uncertain** ; **strengthening (LC)**
- Hot nights, longer, more frequent heat waves: **L** ↗; **L** further ↗; **VL** substantial ↗
- ↘ in maize and sorghum production: **L**, about 40% ↘ suitable area; **L** larger ↘;  
 major regional food insecurities (**MC**)
- Undernutrition risks : **increased**; **higher**; **high**

Warming of 1.5° C or less  
 Warming of 1.5°C-2° C  
 Warming > 2° C

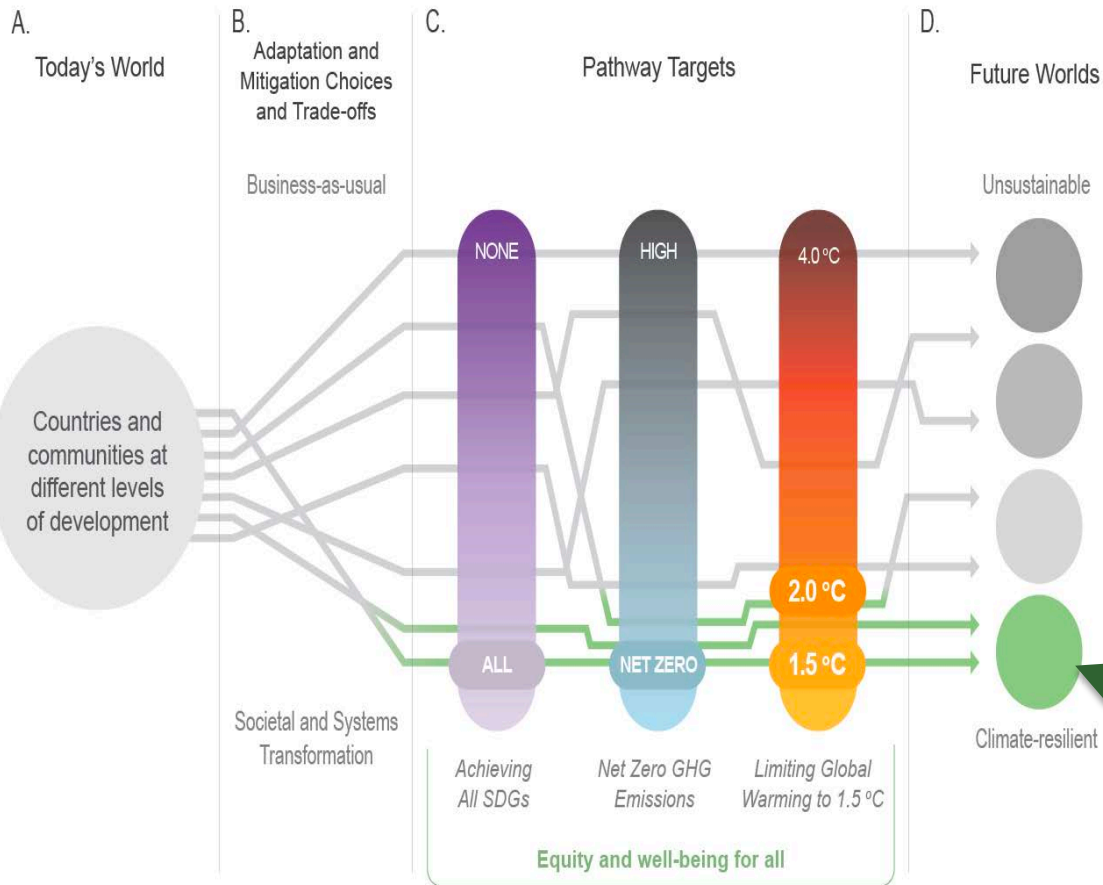

*L, likely*  
*VL, very likely*  
*LC, low confidence*  
*MC, medium confidence*  
*HC, high confidence*

## Southern Africa

- Water availability: **reductions (MC)**; **larger reductions (MC)**; **large reductions (MC)**
- # of hot nights and ↗ heat waves : **increases (HC)**; **further increase (HC)**; **drastic increase (HC)**
- Increased mortality from heat-waves: **high risks**; **higher risks (HC)**;  
**substantial impact on health and mortality (HC)**
- Undernutrition / dryland agriculture and livestock: **high risk**; **higher risk (HC)**; **very high risks**

# Response Options

## Response options to limit warming to 1.5 and under 2.0 degrees

Accelerated radical changes needed in four systems;

- energy,
- land use and ecosystems,
- urban infrastructure,
- industry

# CLIMATE CHANGE AND LAND

An IPCC Special Report on climate change, desertification, land degradation, sustainable land management, food security, and greenhouse gas fluxes in terrestrial ecosystems.

REPORT COVER IMAGE:

Agricultural landscape between Ankara and Hattusha, Anatolia, Turkey (40° 00' N – 33° 35' E)

# Land is where we live

Land is under growing human pressure

Land is a part of the solution

But land can't do it all

Table 6.70 Impacts on Nature's Contributions to People of integrated response options based on land management

Integrated response options based on land management	Habitat creation and maintenance	Pollution and disposal of seeds and other propagules	Regulation of air quality	Regulation of climate	Regulation of ocean acidification	Regulation of freshwater quantity, flow and timing	Regulation of freshwater and coastal water quality	Terrestrial, freshwater and marine ecosystems: decomposition of soils and sediments	Regulation of hazards and extreme events	Regulation of organisms detrimental to humans	Energy	Food and feed	Materials and assistance	Medicinal, biochemical and genetic resources	Learning and inspiration	Physical and psychological experiences	Supporting identities	Maintenance of options
Increased food productivity																		
Improved cropland management																		
Improved grazing land management																		
Improved livestock management																		
Agroforestry																		
Agricultural diversification																		
Avoidance of conversion of grassland to cropland																		
Integrated water management																		
Forest management and forest restoration																		

**Land is a critical resource – we rely on it for food, water, health and wellbeing – but it is already under growing human pressure. Climate change is adding to these pressures**

**A challenging situation which is worse and undermining food security**

**Agriculture, food production, and deforestation are major drivers of climate change.**

Coordinated action to tackle  
“climate change can  
simultaneously improve land,  
food security and nutrition,  
and help to end hunger.

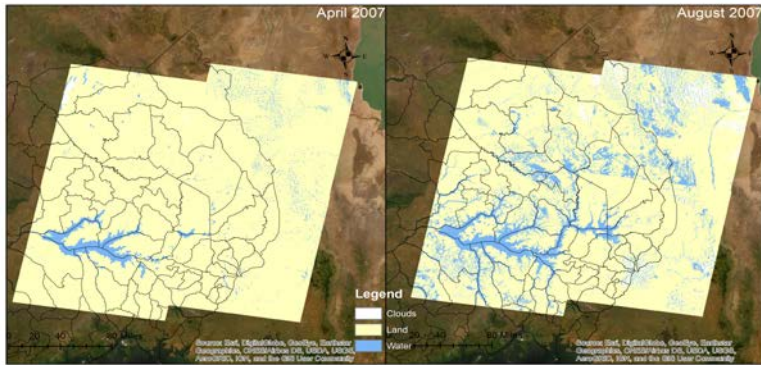

**There are actions available to us that can simultaneously improve land, enhance food security and improve nutrition.**

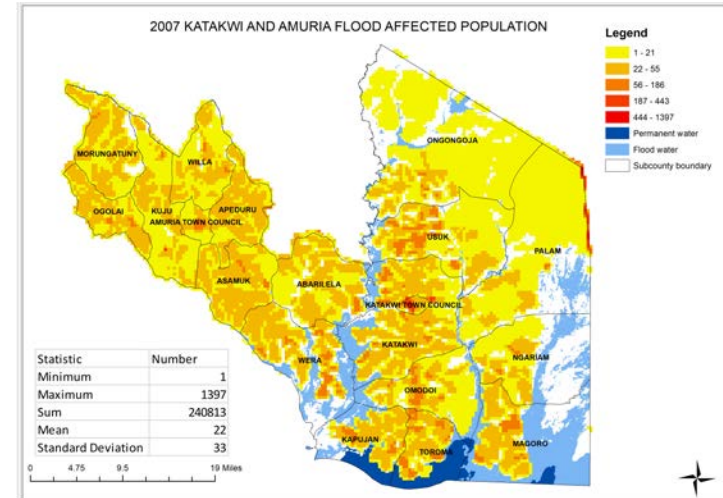

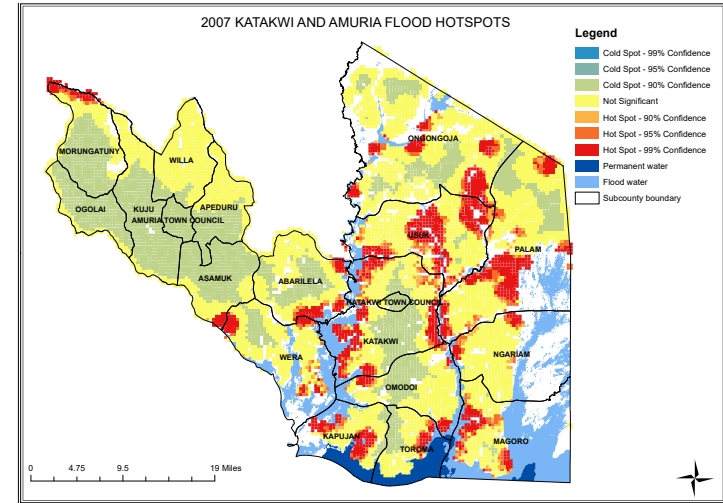

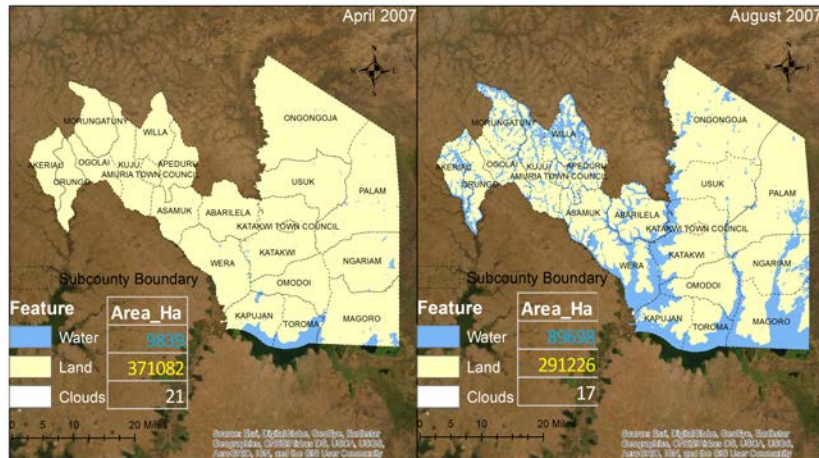

# Localizing the land-based responses in Uganda

## A case study of Karamoja-Teso region

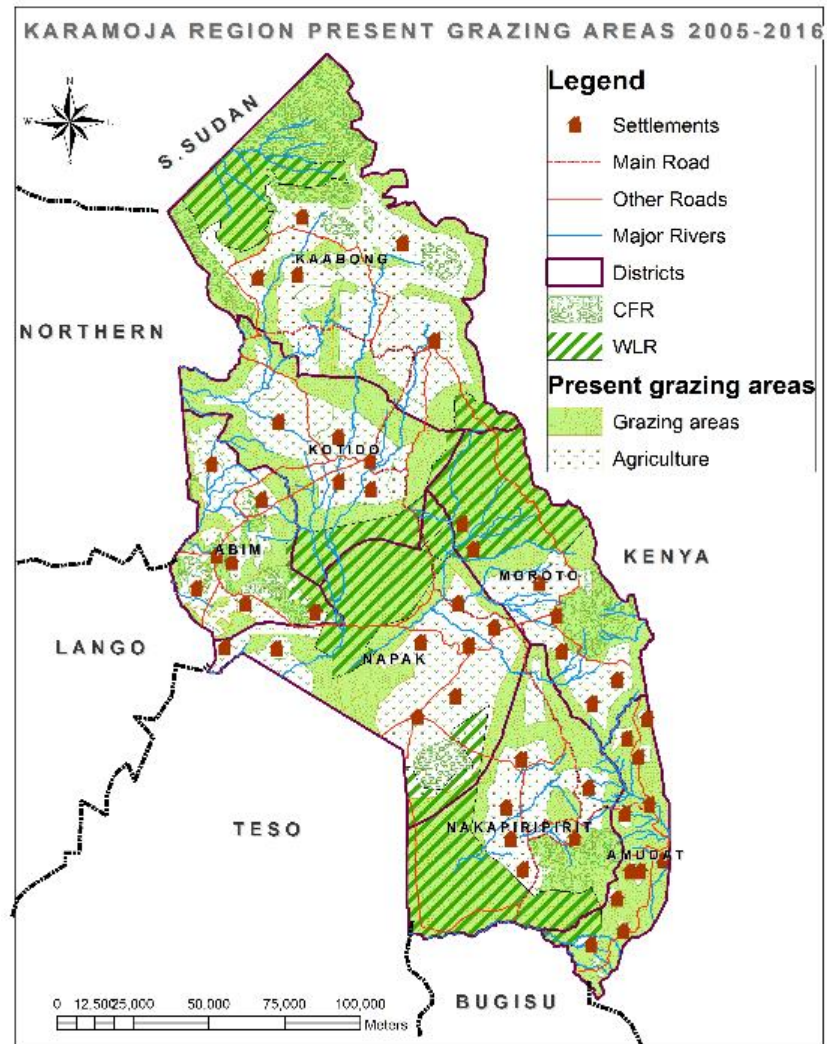

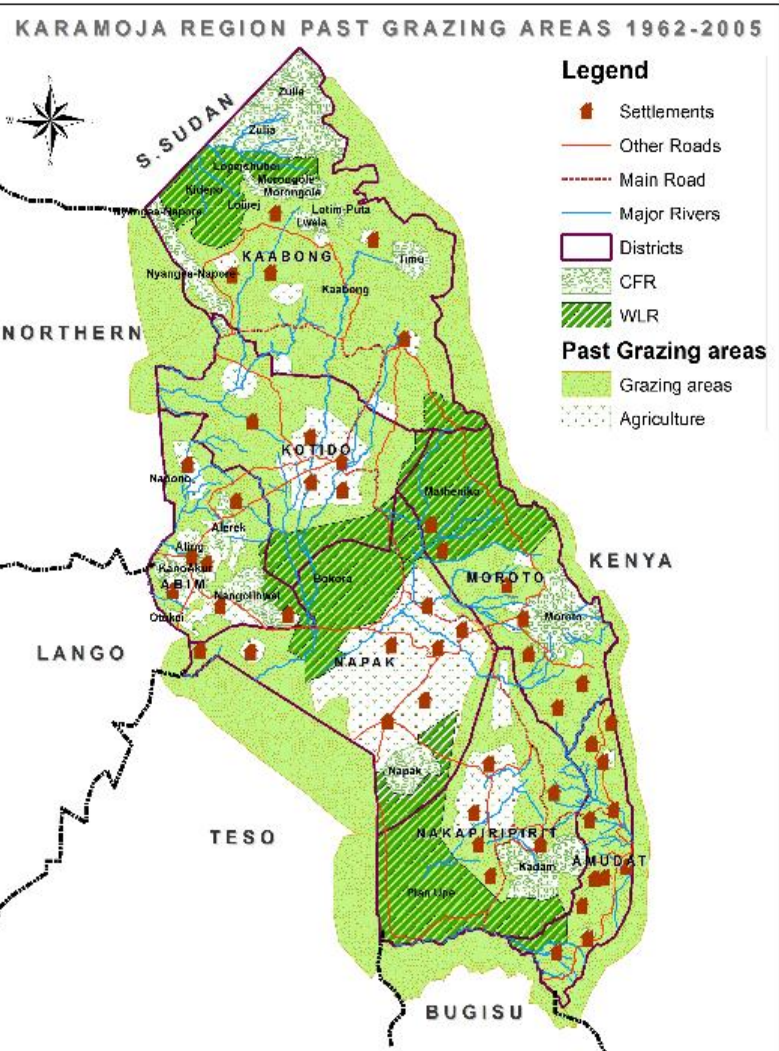

2007 FLOODS, NORTH EASTERN UGANDA

KATAKWI AND AMURIA FLOODS, 2007

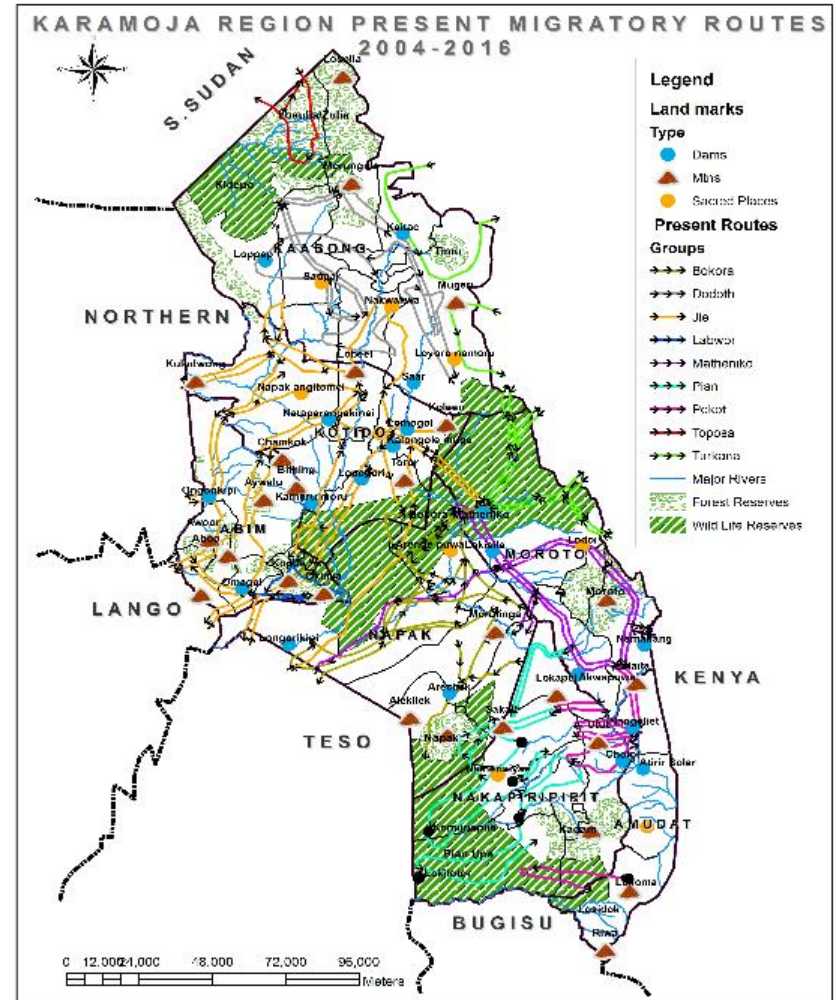

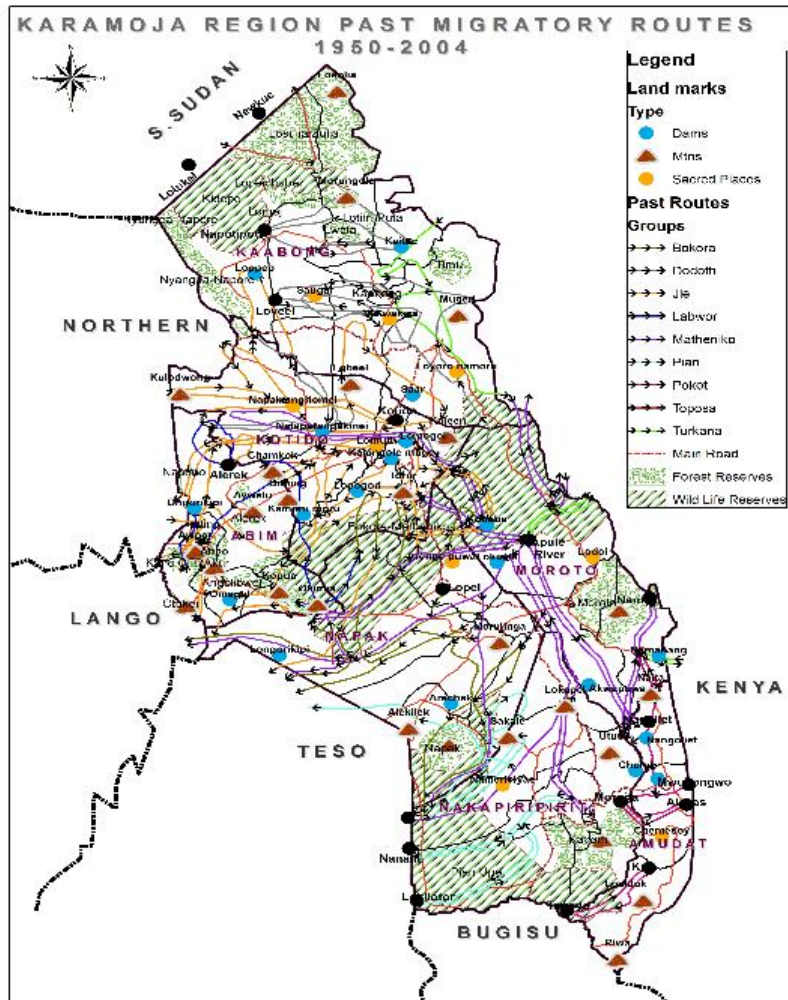

# A case study of Karamoja Grazing Areas, Past and Present

# Livestock Migratory Routes, Past & Present

# Conclusion

- Urgency of climate action
- Importance of institutional transformation (judiciary, finance, governance, administration) at all levels
- Reducing emissions is for all countries INDC's, Paris Agreement
- There are known and practiced response actions that can address impacts of climate change
- Transition to LED
- Low hanging, low cost nature-based solutions

---

- Thanks!
